Dream parking

No ramp access to the parking areas, but liveable gardens

Relax and exclusivity with **IdealPark**

About us and what we do

IdealPark, an **ISO 9001** certified company based in Verona, is a leader in the field of mechanised parking and car lifts with **50 years of experience** in the market of lifting systems. With strong skills acquired over the years and know-how on safety and regulations, IdealPark subsequently engaged in the strategic sector of technology applied to car lifts, creating cutting-edge products distributed around the world.

IdealPark car lifts are the ideal solution for any construction work where there are space problems for creating traditional access ramps to the garage or parking floors. The car lifts allow for the transport of cars two or more levels up using an area of only 15 square metres while a conventional ramp occupies an area ranging from 50 to 70 square metres. The space saved can then be used for additional parking spaces or a garden or a courtyard.

IdealPark lifts are designed and manufactured entirely in Italy at the company headquarters in Settimo di Pescantina, Verona, allowing the staff to monitor each phase directly: from the feasibility study to final installation. The electric and hydraulic components are purchased only from the best Italian producers as part of a total quality approach. The technical department, dedicated to research and development, studies customised solutions and engages in the design of new systems, in an effort to offer its clients more innovative systems oriented to environmental sustainability and energy saving. Materials, software, and finishes used are in fact chosen to minimise the impact on the environment.

The company philosophy is based on the quality of the system which, even in its standard version, is equipped with devices and accessories that **enhance comfort and guarantee maximum safety to the user**.

Designs

Experience, flexibility and great attention to aesthetics and architectural integration with the surrounding environment, make IdealPark the ideal partner for renovations, building recovery and interventions in historic or prestigious buildings. IdealPark is attentive to the evolution of the automobile market which, since 1970, has carried cars of ever increasing sizes and weights. Following the trend of cars, new lifts have been designed to even carry Limousines. Among its clients the company counts demanding automobile brands such as Lamborghini and Ferrari and the National Automobile Museum. Private clients, businesses, companies, engineers and architects find in us a partner who provides custom and tailor-made solutions and designs. A wide choice of options allows each client to customise their system, making it unique and unmistakable.

For IdealPark, every project is a challenge to improve and meet the needs of each client.

IdealPark

IP1- CM MOB

No ramp access to the parking areas, but **liveable gardens**.

IdealPark, a leading company in Italy in the field of mechanical parking systems, presents the latest innovation in the field of car lifts: the IP1-CM MOB, a car lift with cover approved for the transport of the driver.

This extremely quiet system differs from other products on the market for the perfect integration with architecture. Unsightly fences are not in fact needed due to the presence of a series of safety features such as a camera at ground floor, a color display and LCD touch screen on board that allow to monitor the system and its surrounding area during its operation. The outside space remains completely free and livable and can be set to a garden or courtyard.

To contribute to a completely invisible and prestigious result there is the possibility of paving the roof covering with any material. Through a wide choice of colors, lighting and finishes, you can customize your system for a unique result and in harmony with the surroundings.

The cars parked in the basement are protected, as they can be removed only by inserting a coded key into the control panel to operate the plant. Even the parking lot has then its security and privacy.

For those who like to take care of the details of their home, avoiding ramps or cars parked on the surface without sacrificing green space or courtyards, the solution is the invisible garage, built using the new and exclusive system.
